Summary

- climate change will continue to effect Oregonians
- Oregon will continue to warm in all seasons, especially summer
 - fire, snow, agriculture - temperature sensitive, cascading social, economic, and ecological effects
 - reducing global emissions will reduce warming
- big fire seasons in past 15 years tend to be hot, dry summers
- coastal impacts with global sea level rise and coastal flooding, crucial infrastructure at risk
- frame questions to “did climate change make this event/season more likely”

thank you!

@kathiedello

key findings from 2017 report

- climate change will continue to impact the health of Oregonians, especially vulnerable populations,
- Oregon will continue to warm; we can now attribute some regional trends to human activity
- declining mountain snowpack is, and will have significant impacts on water resources
- increased coastal flooding and erosion
- ocean acidification
- shifting climates plus disturbances (fire, insects, diseases) will drive forest change
- short-term gains for agriculture, but long-term dependent on adaptations to heat and water
- recent climate events a practice run for the future
